

MSR Engineering Documentation (MEDOC) Elements and attributes of MSRREP.DTD

MSR MEDOC, Dipl.-Ing. Roman Reimer, STZ XI-Works

Abstract

This is a reference document for *MSRREP DTD* describing all elements and attributes. *MSRREP DTD* is part of the MSR development documentation MEDOC.

1 How to read this document

The following conventions apply

This document is written using *MSRREP DTD*. The following conventions apply to this document:

- <msrsw>** SGML elements are noted as technical term **[type]=SGMLTAG**.
- [type]** SGML attributes are noted as technical term **[type]=SGML-attribute**.
- sgml-attribute* Values of SGML attributes or discrete values for elements are noted as technical term **[type]=code**
- ASAP2 The considered languages resp. DTDs are marked as technical term **[type]=product**.
- ASAP The committees are noted as **[type]=organization**
- ECU Objects in general are marked as technical terms **[type]=other**. This might be automotive equipments general objects such as variables etc.

Graphical conventions used in DTD diagrams

The structure of DTDs is shown in the MSR document as DTD diagrams (see [Figure 1 convention in DTD diagrams p. 10](#)).

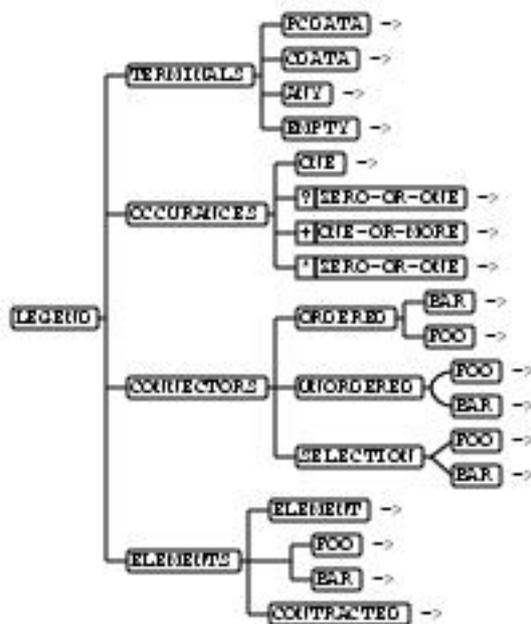

Figure 1: convention in DTD diagrams

The meaning of the symbols is:

- PCDATA **Processable Character Data (PCDATA)** Data that consists of zero or more characters of both text and markup. PCDATA is a declared content keyword. PCDATA is used to indicate that all markup delimiters defined in the SGML declaration will be recognized by the parser as markup in the given element rather than data characters.

RCDATA	Replaceable Character Data (RCDATA) is data that consists of zero or more characters, in which references to substitutions are not recognized (i.e. RCDATA may contain text and entity references, but no sub-elements). See also: CDATA PCDATA.
CDATA	Character Data (CDATA) consists of zero or more text characters, where no markup of any kind is recognized. CDATA is an SGML term. Note that character references are allowed in a CDATA entity (substitution) but not in CDATA content.
ANY	a terminal type indicating that the object may contain text or any element defined in the model.
EMPTY	a terminal type keyword used to indicate that there is no data (i.e. no content, sub-elements or end-tags) for the object allowed in the document instance. This keyword is often used to describe elements that are placeholders or are pointers to external or system-generated data.
One	indicates that the element or the element group occurs exactly once
ZERO-OR-ONE	indicates that the element or the element group is optional
ONE-OR-MORE	indicates that the element or the element group occurs multiple times but at least once
ZERO-OR-MORE	indicates that the element or the element group occurs multiple times but also can be missed (optional)
ORDERED	a connector used to specify that the sibling objects must appear in the document in the order shown in the model
UNORDERED	a connector used to specify that the sibling objects can appear in any order in the document.
SELECTION	a connector used to specify that only one of the sibling objects can appear in the document.
ELEMENT	indicates a single SGML structure element
COLLAPSED	indicates, that the content of the element is not displayed here

Description Specifies a column, a vertical portion of a <entry>. The default values come from the <tgroup>, <thead> or <tfoot> starting the current group. Each <colspec> is for a single column, so it properly has a column number, column, implicitly in order starting from 1, and an optional colname by which it is known when used in any <spanspec> or in <entry>. A <colspec> set on <thead> or <tfoot> should be complete for all columns. It overrides those on the containing <tgroup> and applies to just the <thead> or <tfoot>. If there is no <colspec> used within <thead> or <tfoot>, then the <colspec> of the containing <tgroup> is used. <colspec>s from the containing <tgroup> apply to <tbody>.

Description Identifies a horizontal span of columns and associated attributes that can subsequently be referenced by its spanname to provide attributes repeatedly used in the entries or entry tables in several rows of the table group controlled by the group `<colsdef>`, or within the specific `<thead>`, `<tfoot>`, or `<tbody>` context in which the `<spanspec>` occurs. `<Namest>` and `<nameend>` identify the first and last columns in increasing order that identify the span. The reason `<colname>` is used rather than `<colnum>` in identifying `<spanspec>` is that the names are independent of revisions that may change the number of inserted/deleted columns, as long as `namest` remains to the left of (has a smaller `colnum` than) `<nameend>`. `<spanspec>`s set on `<thead>` or `<tfoot>` override those on the containing `<tgroup>` and apply to just the `<thead>` or `<tfoot>`. `<spanspec>`s from the containing `<tgroup>` apply to `<tbody>`.
